CONTROLMASTER®

Maximise machine utilisation and safety in any environment

REMOTE CONTROLLED ROCKBREAKERS

RCT is experienced in commissioning and installing remote controls on rock breakers to meet specific requirements in mobile, fixed, underground and surface environments.

The Control Master® range offers three remote control options to suit all applications. These range from the handheld Line-of-Sight remote, used in a surface operation to physically remove the operator from the rock breaker and allow them to operate the machine from safe distance. Teleremote, which is commonly used for underground mining as it removes the operator from the potential hazards of the working area to ensure their safety and decrease time lost during shift changes. Semi-Autonomous functionality is also available to further safeguard operators, reduce machine damage and downtime to increase productivity and profitability.

In addition to providing the most suitable remote for the working environment, RCT will deliver an operator station to suit each individual project's needs. These stations range from small portable systems, through to Telecabins which provide operators with an ergonomic working environment on site; to remote operating centres which enables work to be carried out from the convenience of another location.

All Control Master® remote options can be installed on any rock breaker, regardless of brand, make or model. They are built to exceed the harshest of conditions and as a result they exceed Australian standards.

Features

- Line-of-Sight, Teleremote or Semi-Autonomous options available
- Maximises machine utilisation
- Removes operator from potential hazards on site
- Significantly improves the operators working environment
- Allows operators to control multiple machines from the one location
- AS4240 compliant
- Numerous operator station options available to suit requirements
